What is Autism?

Autism Spectrum Disorder (ASD), is a complex, lifelong developmental condition that typically appears during early childhood and can impact a person’s social skills, communication, relationships, and self-regulation. The Autism experience is different for everyone and can include a certain set of behaviors and is often referred to as a “spectrum condition” that affects people differently and to varying degrees.

Facts & Statistics

- Boys are three to four times more likely than girls to be diagnosed with Autism.
- Since 2000, the Autism prevalence rate has been consistently increasing from one in 150 to now one in 68.
- Since 2007, the Autism prevalence has risen by 25% each year.
- The diagnosis rate for Autism is rising by 10-17% each year.

Support

Getting the help you need.

Early identification is associated with dramatically better outcomes for people with Autism. The earlier a child is diagnosed, the earlier they can begin benefiting from early intervention therapies and education.

There are no medical tests, such as blood work or brain scans, for diagnosing Autism. An accurate medical diagnosis must be based on observation of the individual’s communication, social interaction, and their activities and interests. While there is not a single behavioral or communication test that can detect Autism, several Autism-specific tools are now being used for formal diagnosis. The characteristic behaviors of ASD may or may not be apparent in infancy (3 to 30 months), but usually become obvious during early childhood (24 months to 6 years).

Currently, there is no cure for Autism. However, continued research has provided a clearer understanding of the disorder and has led to better treatments and therapies that can positively improve quality of life. The Autism Society is the largest and oldest grassroots Autism organization in the United States. Our mission is to create connections, empower individuals with Autism, and support the Autism community with the resources needed to live fully. The Autism Society and approximately 700 local affiliates serve over half a million individuals in the Autism community through information and referrals, education, community, advocacy, and support.

Signs & Symptoms

- Restricted or repetitive behaviors, movements, or phrases
- Co-occurring conditions including but not limited to, mental health illnesses, gastrointestinal issues, seizure disorders, and more.
- Lack of response to normal stimuli (i.e. his/her name, visual cues)
- Avoiding eye contact
- Restricted or repetitive behaviors, movements, or phrases
- Delayed movement, language, and/or cognitive skills
- Atypical verbal communication, non-speaking, or difficult understanding or expressing feelings

Intervention should start when an Autism diagnosis is suspected, rather than when a formal diagnosis is made.

Screening

All children should be screened for Autism by their family pediatrician three times by the age of three (9, 18, and 24 or 30 mos.).

Vaccines do not cause Autism.

Over the next decade, an estimated 7.2 million to 1.1 million + Autism cases will enter adulthood and need out of school-based services.

The cost of caring for Autistic Americans is estimated at $604 billion for adults in 2025 in the absence of more-effective interventions and support. A decade from now, these costs will be $840 billion. These costs are for adult services.

Supporting our National Helpline offers our trained Information & Referral (I&R) Specialists to provide resources to services and supports across the country.

To speak to an I&R Specialist directly, call 800-3-AUTISM (800-328-8476) or email info@autism-society.org (24 hrs-6 am to 2 pm ET).
